INTRODUCTION

Anxiety is a state of excessive fear which is characterized by motor tension, sympathetic hyperactivity, apprehension and vigilance syndromes. It also includes debilitating physical manifestations such as headaches, uncontrolled trembling, sweating, muscle tension and aches. Among the world population, about one-eighth is suffering from anxiety and it has become a very important area of research interest in psychopharmacology. In Allopathic system the anxiety disorders are usually treated with Benzodiazepines (BZDs), Barbiturates and Tricyclic antidepressants (TCA’s). The unwanted effects associated with these drugs, namely rebound insomnia, sedation, muscle relaxation, withdrawal and tolerance (BZDs and Barbiturates), sexual dysfunction, anticholinergic and antihistaminic effects (TCA’s) have limited their use in patients suffering from anxiety. Hence many pharmaceutical companies are conducting studies to find an alternative medicine or plant-derived medications with more specific anti-anxiety effects.

Herbal medicines have been used to treat central nervous system (CNS) disorders from many centuries. Importance of plant-derived medications that affect the "mind" is growing globally. Different herbal medicines have been used as anxiolytic drugs in various parts of the world. Triphala is an Ayurvedic herbal formula consisting of equal parts of three myrobalans (dried plumlike fruits) taken without seed: Amalaki (Emblica officinalis), Vibhitaki (Terminalia bellirica), and Haritaki (Terminalia chebula). The Sanskrit word Triphala literally means "three fruits." Terminalia chebula, one of the ingredients in triphala belongs to family Combretaceae. It is a medium to large-sized tree distributed throughout tropical and sub tropical Asia, including China and Tibet. This tree wildly grows in the forests of Northern India, Uttar Pradesh, Bengal and is common in Tamil Nadu, Karnataka and in Southern Maharashtra. The fruit of Terminalia chebula is used medicinally in Indian system of medicine. In Ayurveda, this drug is considered to be a rasayana (with literal meaning: Path (ayana) of the Juice (rasa), or Elixir vitae) for Vata, balances all three doshas (tridosham), enhances digestion (dipanapachana), sharpens the senses (medhyam), and displays alterative, astringent, expectorant, anti-inflammatory, anodyne, cardiac tonic, laxative, antiseptic, and anti-epileptic properties.

The chronic anxiolytic activity of Aqueous Extract of Fruits of Terminalia chebula (AETC) by Light and Dark Arena in Swiss albino mice. The mice weighing 25-30gm were divided into 5 groups containing 6 animals for each dose and were housed for 10 days prior to testing. The control (1% Gum acacia), test drug AETC (1.3, 2.6 and 5.2 mg/ kg) and standard drug Diazepam (1.0 mg/kg) were administered orally for ten days. On 10th day, one hour after oral administration of the drugs / vehicle, the experiment was conducted. The results suggest that, behavioural disinhibitory effects of AETC exhibited anxiolytic activity at the dose of 1.3 and 2.6 mg/kg comparable to diazepam. The results of this study support the use of Terminalia chebula, in Ayurvedic system to treat anxiety and depression in patients suffering from anxiety. The AETC exhibited antianxiety effects through mechanism different from diazepam and this is useful in cases where diazepam can not be administered.

MATERIALS AND METHODS

The experimental protocol was approved by the Institutional Animal Ethics Committee (IAEC) of Yenepoya Medical College, Mangalore, India.

Animals

Adult male Swiss Albino mice weighing 25-30 gm from our breeding stock were used in this study. The animals were housed at 24±2°C with 12:12 h light and dark cycle. They had free access to food and water ad libitum. The animals were acclimatized for a period of 10 days before the study. The study was conducted according to CPCSEA guidelines.
Sample Size, Grouping and Dose of the Drugs

Animals were divided into 5 groups (Control, Standard & Test drug) containing 6 animals making a total number of 30 animals (Table 1).

Drugs and chemicals

The standard anxiolytic drug Diazepam was obtained from our institutional pharmacy. The test drug Terminalia chebula was provided by Al Thary Enterprises, Mangalore. 1% gum acacia (vehicle) from Dept of Pharmacology, Yenepoya Medical College, Yenepoya University, Mangalore.

Apparatus: Light and dark arena

The apparatus consisted of an open top wooden box. Two distinct chambers, a black chamber (20 X 30 X 35 cm) painted black and illuminated with dim red light and a bright chamber (30 X 30 X 35 cm) painted white and brightly illuminated with 100W white light source, were located 17 cm above the box. The two chambers were connected through a small open doorway (7.5 X 5 cm) situated on the floor level at the centre of the partition.

Behavioural assessment

The animals were divided randomly into control and experimental groups (n=6). Group 1 received the vehicle, 1% gum acacia(10ml/kg) and served as the control group, groups 2, 3 and 4 received AETC in doses of 1.3, 2.6 & 5.2 mg/kg, and group 5 received the standard drug Diazepam (1.0mg/kg) per orally for ten days. On 10th day behavioural evaluation was carried out 60 minutes post drug/vehicle administration. Anxiolytic activity of AETC was evaluated using the experimental model of Light and Dark arena (Table 2). Behavioural assessment was carried out by observing the time spent in bright arena, number of entries in to bright arena and number of rears in bright arena.

Statistical analysis

The data were analyzed by one-way ANOVA and Post-hoc comparisons were performed by applying Dunnett’s multiple comparison test. P <0.05 was considered statistically significant.

AETC- Aqueous Extract of Terminalia chebula.

RESULTS AND DISCUSSION

Anxiety is a psychological and physiological state characterized by cognitive, somatic, emotional, and behavioural components. Benzodiazepines (BZDs) are the major class of compounds used in anxiety and they remain the most commonly prescribed treatment for anxiety. Hence the search for safe and effective alternate anxiolytic agent. Fruits of Terminalia chebula have many medicinal uses and AETC contains phenolic compounds and tannin. Tannins have neuroprotective function and antioxidant property.

In the present study, we have attempted to evaluate the acute anxiolytic activity of Aqueous Extract of fruits of Terminalia chebula (AETC) by Light and Dark Arena in Swiss albino mice. Behavioural assessment was carried out by observing the time spent in light arena, number of entries in to light arena and number of rears in light arena.

Our results (Table 2) suggest that, behavioural disinhibitory effects of AETC exhibited anxiolytic activity at the dose of 1.3 and 2.6 mg/kg comparable to diazepam by increase in time spent in bright arena (p<0.01). In the dose of 1.3 mg /kg (p<0.05) and 2.6 mg /kg (p<0.01) shows the increase in number of entries in to the bright arena. Number of rears were also increased in the dose of 1.3 and 2.6 mg/kg (p<0.01) in the bright arena.

CONCLUSION

The results suggest that, behavioural disinhibitory effects of AETC exhibited anxiolytic activity at the dose of 1.3 and 2.6 mg/kg comparable to diazepam. However, further studies are needed to evaluate its mechanism of action and therapeutic benefit as an adjuvant in the treatment of anxiety disorders.
