ABSTRACT
Many medicinal plants represent a rich source of drugs individually or in combination have been recommended in various medical treaties for the cure of different diseases. Adina Cordifolia (Roxb.) is an India, Ceylon, Thailand, and Burma; scattered in mixed deciduous forests used by traditional healers for the treatment of chronic cough, and uses in jaundice, stomachache, fodder and swelling in stomach, The Roots are astringent and constipating, and are useful in diarrhea and dysentery. The bark is acrid, bitter, astringent, refrigerant, vulnery, diuretic, demulcent, aphrodisiac and tonic. It is useful in vitiated conditions of pitta, wounds and ulcers, straungury, skin disease, gastropathy, fever and burning sensation. In the literature Adina cordifolia is described as to have wide range of medicinal applications. It has been used as Antiamoebic, Antiinflammatory, Antinociceptive, Antifertility. This paper explains the evidence based information regarding the Phytochemistry, Pharmacological activity and Medicinal Uses of these plants.

Keywords: Adina Cordifolia, Phytochemistry, Pharmacology, Medicinal uses.

INTRODUCTION

In ancient times, medicinal plants have been used all over the world as unique sources of medicines and may constitute the most common human use of biodiversity. According to the World Health Organization, 80% of people in developing countries still depend on local medicinal plants to fulfill their primary health needs. In India there are about 550 tribal communities covered under 227 ethnic groups residing in about 5000 villages in different forest and vegetation types. India with its glorious past of traditional medicinal system and use pattern of different plants is one of eight major centers of origin and diversification of domesticated taxa. Having rich biodiversity and is one of the world’s twelve mega diversity countries. Besides that, there is a global consensus on the benefits of phytopharmacy and at present medicinal plant. Occupy a key position in plant research and medicine5. Many Plants species which are extensively used as medicine need phytochemical investigation to search active medicaments. Many Plants Species containing active ingredient of medicinal values are yet to be discovered. This fact prompted us to undertake phytochemical investigation of plants for the research6.

A wide range of medicinal plant parts is used for extract as raw drugs and they possess varied medicinal properties. The different parts used include leaves, root, stem, flower, fruit, twigs exudates and modified plant organs. While some of these raw drugs collected in larger quantities and traded in the market as the raw material for many herbal industries5. Herbal medicinal which is the use of medicinal plants or drugs from medicinal plants in the treatment and cure of sickness and diseased conditioned4. The herbal products today symbolize safety in contrast to the synthetics that are regarded as unsafe to human and environment. Although herbs had been priced for their medicinal, flavoring and aromatic qualities5. Herbal medicine is a major component in all indigenous people’s traditional medicine and a common element in ayurvedic, Homeopathic, Unani, Naturopathic, and Traditional Oriental6.

In Rubiaceae family containing plants are used as medicinal use and contain the secondary metabolides. Rubiaceae is by far the largest family in the flowering plants ordergentianales.

It is also the oldest family that branched off on the gentianales family tree. The family Rubiaceae comprises about 450 genera and 6500 species and includes trees, thousand infrequently herbs7-10. Among the many plants Adina Cordifolia is one from Rubiacea family.

BOTANICAL DESCRIPTION

Botanical Name : Adina cordifolia (Roxb.)
Family : Rubiaceae
Synonym : Haldina Cordifolia (Roxb.)
Local name : Kadami, Haldu
English name : Yellow Teak, Saffron Teak.

Description of Morphology
A large deciduous tree, under good conditions grows, over 30 m., but is normally about 14 - 20 m tall, leaves up to 25 cm or more across, broadly oval or circular in shape, acute at the apex, heart-shaped at the base, slightly hairy especially when young, green or tinged with red or pink; nerves a strong one running from the base to the tip of the leaf and 5 - 6 pairs of lateral ones, which unite in a wavy line near the margin of the leaf. Leaves come out in pairs, one on either side of a branch, their stalks
connected by a pair of stipules. These are two leaf-like structures, up to 2.5 cm. long, enclosing and protecting the very young leaves and shoot apex; when the stipules fall away, they leave two clear lines, each encircling half of the branch. Leaf stalks are 5-10 cm. long. Flowers are insignificant individually, being very small; but they come out in balls 2—3 cm. across; the tiny flowers are yellow or yellowish in color, often tinged with pink. When the little flowers open up, the most prominent parts are the styles, which form a sort of halo round the floral ball. Fruits are minute, forming an almost solid ball, which when ripe is black or nearly black. Leaves are shed about February, and the tree remains leafless until about May—June; the stipules covering the buds are than very conspicuous. Flower balls are at their best from June to August. After the fruit proper has been shed at about the beginning of June of the following year, the fruit-heads appear black and are about 12 mm. across: the rains of the monsoon may bring them down and prepare the tree for the new flower balls.

PHYTOCHEMICAL AND PHARMACOLOGICAL OVERVIEW

The chemical constituents of Oleoresin, essential oil, cellulose, β sitosterol in Adina cordifolia Root and Bark. The shade dried bark powder of Adina cordifolia was extracted with ethanol and ethanolic extract was fractionated with different solvents. All the fractions of ethanol extract were screened for their hepatoprotective effect against CCl₄ induced hepatotoxicity in wistar albino rats. The degree of hepatoprotectivity was measured by using biochemical parameters like serum transaminases (SGOT and SGPT), alkaline phosphates, total protein and total bilirubin in the treated groups, and morphological parameters as change in liver weight and liver volume. The ethanol extract and butanol fraction shows significant hepatoprotective activity as comparable with against CCl₄ induced hepatotoxicity as evident by restoration of serum transaminases, alkaline phosphates, total protein and total bilirubin. Histopathology of the liver tissue further supports the biochemical finding confirming the hepatoprotective potential of these two fractions. The present study shows that ethanol extract and butanol fraction of Adina cordifolia is significantly capable of restoring integrity of hepatocytes indicated by improvement in physiological parameter of hepatocytes. Phytochemical screening of ethanolic extract and its four fractions reveals the presence of Alkaloids, flavonoids, saponins, terpenes, tannins, Carbohydrates. The acetone (AEAC) and aqueous extracts (AQEAC) of Adina cordifolia, belonging to the family Rubiaceae, were studied for hepatoprotective activity against Wister rats with liver damage induced by ethanol. Studied on Active principle from root bark of Adina cordifolia was extracted in benzene and ethyl acetate and was seen to exhibit antimicrobial activity with IC₅₀ values of 2.92 and 2.50μg/ml, respectively. Studied extractives of some forest produce including acetone and alcohol extracts of bark and roots of Dalbergia stipulacea, leaves of Eucalyptus hybrid and Adina cordifolia, ursolic acid and bryonolic acid were evaluated as insect antifeedant against poplar defoliator Clostera cupreata (Lepidoptera : Notodontidae). Ursolic acid (separated from Eucalyptus hybrid leaves extract) has shown maximum antifeedant activity and gave over 92 per cent protection of poplar leaves from its pest. It was followed by alcohol and acetone extracts of Eucalyptus hybrid leaves, bryonolic acid, acetone extract of D. stipulacea bark, alcohol extract of A. cordifolia leaves. Studied on the plants like Adina cordifolia, Asparagus racemosus, Aegle marmelos, Cassia Tora, Dillenia pentagyna, Valeriana walliichii showed little activity (5 to 8mm) against some pathogenic microorganisms. Isolation of 7-hydroxycoumarin and 7-beta-D-glucosyl icoumarin, respectively. Umbelliferone was converted into 7-acetoxycoumarin, which on treatment with aluminum chloride afforded 7-hydroxy-8-acetylcoumarin. A new series of thiosemicarbazones of 7-hydroxy-8-acetylcoumarin with different thiosemicarbazides were synthesized. Umbelliferone was also converted into its methoxy derivative (7-methoxycoumarin). Subsequently all the compound assessed antiamoebic activity. Carried studies Petroleum ether and ethyl acetate extracts of Adina cordifolia were screened for anti-inflammatory and analgesic activity. Studied on extract of Adina cordifolia leaves and Bark using the solvent Dichloromethane and methanol shows the activity against micro-organism. A new Indole alkaloid from the heartwood of Adina Cordifolia. Haldinia cordifolia stem had been evaluated for its antulcer potential. Enzyme assay-guided fractionation of the chloroform extract yielded 7-hydroxycoumarin as the active constituent which showed interesting HqrKq ATPase inhibitory activity. Studied on Preliminary pharmacology of acetone extract fraction of wood of Adina cordifolia. Four compounds isolated from the stem of Adina cordifolia were identified as stigmasta-5, 22 – diene -3β-O-rhamnopyranosyl-(1-D-xylpyranoside, α-amyрин, octacosanol, and naringenin-7-methylthetery-4’-a-L4) – β O-a-L-rhamnopyranoside on the basis of spectral and chemical evidence. Studied on Four compounds isolated from the stem of Adina cordifolia were identified as stigmasta-5,22-diene-3P-O-a-rhamnopyranosyl-(1-4)-P-D-xylopyranoside, α-amyрин, o-ctacosanol, and naringenin – 7 - methyl ether - 4’ - O - a - rhamnopyranosinde the basis of spectral and chemical evidence. Medicinal Uses Known So For

Fresh bark is ground with brown sugar and taken internally for stomachache. Bark and leaves are used for cholera, cold cough, fever, headache, Scars and skin yellowish of body, urine complaints. Laves are used on cough and cold. Fresh stem bark juice is taken in rheumatism. Latex is applied on aching tooth. Stem bark used on fever. Leaves are applied over swollen portion to remove pain and swelling. Bark is used as an antibacterial, eczema, Scabies, Bark paste is applied to eczema, Scabies, or bacterial infections on the skin.
used on the urinary problem\textsuperscript{36}. Leaf juice is used to treat boils and eye disorders like conjunctivitis\textsuperscript{37}. Bark is used on burning sensation of urine\textsuperscript{38}. Stem bark powder is used to prevent miscarriages\textsuperscript{39}. Stem bark is crushed, warmed and applied in the region of abdomen and loin against bodyache\textsuperscript{40}. Paste stem bark and leaves are used in deep wounds, Jaundice, Stomachache, and swelling in stomach\textsuperscript{41}. Decoction of stem bark is used in the morning for 4-5 days\textsuperscript{42}. \textit{Adina cordifolia} are gives activity of Antibacterial, antiseptic, antibilious, febrifuge\textsuperscript{43}.

CONCLUSION

The present work was carried out on plant Adina Cordifolia family; Rubiaceae here more emphasis was given on literature reviews of phytochemical & Pharmacological reviews on Adina Cordifolia Plants. After thorough investigation and literature search it was observed that less work has been done on this plant especially on its leaves. In traditionally the plant \textit{Adina cordifolia} has a large demand due to its treatment of many chronic and acute diseases with great benefits. This study attempts to high lighten the Therapeutic potential of \textit{Adina Cordifolia} and their constituents in the prevention or therapy of disease. From this study we can conclude that the results reviewed in the study are aimed at attracting the attention of researchers seeking new drugs from \textit{Adina cordifolia} and its chemical compounds. The isolated compounds can hopefully be considered in future for more clinical evaluations and possible applications and as adjuvant to current medications. We should maintain our efforts in considering and valorizing our natural patrimony as well as conducting more research in \textit{Adina Cordifolia} and its Pharmacological aspects.
