ABSTRACT

The study was designed to investigate the possible protective role of argan oil in mercuric chloride induced renal stress, by using biochemical approaches. The effects of argan oil on mercuric chloride induced oxidative and renal stress were evaluated by serum creatinine, urea and uric acid levels, kidney tissue lipid peroxidation, GSH levels, GSH-Px and GST activities. Administration of mercuric chloride induced significant increase in serum: interleukine 1, interleukine 6 and tumor necrosis factor α (TNFα) levels, creatinine, urea and uric acid concentration showing renal stress. Mercuric chloride also induced oxidative stress, as indicate by decreased kidney tissue of GSH level, GSH-Px and GST activities along with increase the level of lipid peroxidation. Argan oil treatment markedly reduced elevated serum: IL1, IL6, TNFα, creatinine, urea and uric acid levels and counteracted the detorious effects of mercuric chloride on oxidative stress markers changes caused by HgCl2 in kidney. Our results indicate that argan oil could have a beneficial role against mercuric chloride induced nephrotoxicity and oxidative stress in rat.

Keywords: Antioxidant enzymes, Pro-inflammatory cytokine, Mercury, Renal stress, Argan oil.

INTRODUCTION

Mercury is a well-known human and animal nephrotoxic agent. Acute oral or parenteral exposure induces extensive kidney damage. 1, 2. Studies in vivo and in vitro have demonstrated that mercury induced lipid peroxidation, suggesting the involvement of oxidative stress in its cytotoxicity. 3, 4 Lund et al. (1993) 5 reported that mercury enhances renal mitochondrial hydrogen peroxide formation in vivo and in vitro. However, causative correlation between mercury induced lipid peroxidation and cellular toxicity remains controversial. Some authors reported that lipid peroxidation plays a critical role in cell injury induced by mercury in renal cells 6, whereas other investigators showed that lipid peroxidation is not directly responsible for mercury induced cell injury in hepatocytes and renal cells. 5, 6. It is important to develop an effective drug for mercury to prevent the mercury induced cellular damages. Historically, plants have been used as folk medicine against various type of disease.

Argan oil obtained from Argania spinosa L. this oil is also used in traditional medicine. 7 Chemical analysis of this oil highlighted a glyceride fraction (99%) that is mainly rich in polyunsaturated fatty acids like oelic (47.7%) and linoleic (29.3%). 8 Studies with the unsaponifiable fraction revealed, that argan oil is rich in tocopherol (62mg/100g verus 320mg/kg in olive oil and 400mg/kg in sunflower oil), particulary α and γ –tocopherol. 9-10. This fraction also contains other important compounds such as squalene, sterols (schottenol and spinasterol) and phenols (ferulic, syringic and vanillic acid). 9 These compounds make argan oil an important source of antioxidant, which certainly play an important role in vivo. This compound makes argan oil a very important source of vitamin E and also contribute to better preservation of this oil since it protects against oxidation. 11 However, its antioxidative potential against mercury induced oxidative stress remains unexplored. The purpose of this study was to evaluate the protective role of argan oil on mercury chloride induced oxidative and renal stress in rats.

MATERIALS AND METHODS

The argan oil used in this work originated from Tindouf (south-west of Algeria). It was extracted by a traditional method.

All chemicals used in this work were purchased from sigma chemical company. Laboratory animals, Albino Wistar male rats, were brought from the Algiers Pasteur Institute at the age of 8 weeks, with an average live weight of 200g. They were located in a room with an ambient temperature of 21±1°C and up to 12h of light daily. The rats were divided into four experimental groups; each consists of eight rats. The first group was served as the control. The second group was given argan oil at a dose of 5 ml/kg body weight, while the third group (HgCl2) was intraperitoneally given mercuric chloride at a dose of 0.25 mg/kg body weight. Finally, the fourth group was given combined treatment with argan oil and mercuric chloride. The treatment of all groups was lasted for 3 consecutive weeks.

Accepted on: 23-07-2013; Finalized on: 30-09-2013.
Twenty four hours after the last administration the blood was collected by retro- orbital sinus puncture from each anesthetized rats. After centrifugation at 3000 rpm for 10min, the serum was separated immediately and stored at -20°C until determination of: IL1, IL6, TNFα, urea, creatinine and uric acid. Subsequently, rats were decapitated and kidneys were removed.

**Tissue preparation**

About 500mg of kidney was homogenized in 4ml of buffer solution of phosphate buffered saline (w/v: 500mg tissue with 4ml PBS, PH 7.4) homogenates were centrifuged at 10,000xg for 15min at 4°C. And the resultant supernatant was used for determination of: reduced glutathione (GSH) according the method of Weeckbekeretory (1988)12. Thiobarbituric acid- reactive substance (TBARS) level by method of Buege and Aust (1978)13, and glutathione peroxidase (GSH-Px) and glutathione -S-transferase (GST) activities were measured by the method Flohe and Gunzler(1984)14 and Habig et al (1974)15 respectively. However, protein content was measured by the method of Bradford (1976)16.

**Determination of Biochemical parameters**

Serum urea, creatinine and uric acid were determined using commercial kits (Spinreact) and serum IL1, IL6, TNFα levels were assayed using specific Elisa kits for each cytokine (Boster, immunoleader).

**Statistical analysis**

The data were subjected to student t test for comparison between groups. The values are expressed as mean ± SEM. Significance level was set at P<0.05, P<0.01, P<0.001.

**RESULTS**

**Effects of treatment on serum biochemical parameters**

A highly significant (P≤0.001) elevation in serum IL1, IL6, TNFα, urea, creatinine and uric acid levels was observed in mercuric chloride intoxicated rats. Only argan oil treatment did not show any significant alteration. However, the combined treatment of argan oil with mercuric chloride show a highly significant decline in serum IL1, IL6, TNFα, urea, creatinine and uric acid levels was noticed respect to controls (table 1).

**Effects of treatments on renal oxidative stress parameters**

Mercuric chloride exposure a significant depleted in reduced glutathione level, GSH-Px and GST activities. And a highly significant increase in kidney lipid peroxidation level in mercury intoxicated rats was noticed. Argan oil alone treatment did not show any significant decline. In combined treatment of mercuric chloride with argan oil, a highly significant increase in reduced glutathione level, GSH-Px and GST activities. And a significant depletion in lipid peroxidation level was recorded with respect to the control (Fig.1 and 2).

**DISCUSSION**

In the present study, oxidative stress induced by HgCl₂ was evidenced in kidney of rats by increase in lipid peroxidation level and the stimulation of GSH-Px, GST and catalase activities. Accordingly, oxidative stress induced by HgCl₂ has been previously reportd17,18. As a consequence of lipid peroxidation biological membranes are affected causing cellular damage. In the present study, serum urea, creatinine, uric acid levels were significantly increased after 3weeks mercuric chloride (0.25mg/kg), showing insufficiency of renal function. Studies in animals have established that tubular injury plays a central role in the reduction of glomerular filtration rate in acute tubular necrosis. Two major tubular abnormalities could be involved in the decrease in glomerular function in mercuric chloride treated rats: obstruction and backleak of glomerular filtrate18. The alterations in glomerular function in mercuric chloride treated rats may also be secondary to ROS (reactive oxygen species), which induce mesangial cells contraction, altering the filtration surface area and modifying the ultrafiltration coefficient factors that decrease the glomerular filtration rate19,20. Elevated serum level of the cytokine IL1, IL6 and TNFα demonstrated the severity of Hg induced system inflammatory response. Argan oil as an antioxidant agent, ameliorated oxidative injury in the tissues and functional deteriorated.

Values are given as mean ± SEM for group of 8 animals each. *P<0.05, compared to controls. **P<0.01, compared to controls. ***P<0.001, compared to controls.
A clinical event is perceived by tissue macrophages and monocytes, which in turn secrete cytokines such as interleukine1, interleukine 6 and TNFα, indicating the role of this cytokine in this toxicity, while argan oil depressed the IL1, IL6 and TNFα levels response.

Thus, it seems likely that the alleviation of Hg induced oxidative tissue damage by argan oil involves the suppression of a variety of pro-inflammatory mediators produced by leukocytes and macrophages. The activities of GSH-Px and GST that can clear to protect the cells from being injured represents the competence of clearing free radicals from the organism. MDA content manifests the level of lipid peroxidation, and then indirectly represents the level of damage of the cell of renal mitochondria. Evaluating from GSH, MDA levels and GSH-Px, GST activities in kidney of rats. Hg alone significantly decreased GSH level, GSH-Px and GST activities and increased MDA content along with histological damage in kidney.

Co-administration of argan oil and Hg significantly increased GSH level, and activities of GSH-Px, and GST and decreased MDA content.

Some of the active constituents of argan oil have been reported to possess strong antioxidant activity and provokes free radical scavenging enzyme system. Antioxidants are compounds that can delay or inhibit oxidation of lipids or other molecules by inhibiting the initiation or propagation of oxidative chain reaction. The protective effect of argan oil is probably due to its high contents of powerful antioxidants, particularly: polyunsaturated and unsaturated fatty acid, polyphenols, tocopherols, sterols and ß-carotene, which are known as powerful antioxidants.

This products act by several mechanisms: scavenging of peroxyl radicals, which break the peroxidation chain reaction, chelating free Cu2+ to form redox-inactive complexes and thus reducing metal-catalyzed oxidation of lipid and inhibiting the binding of Cu2+ to apolipoproteins and subsequently preventing the modification of amino acid-Apo-B protein residue. Polyunsaturated and unsaturated fatty acid have protective effects against oxidative stress induced by mercuric chloride in rats, which are explained by their double bonds, that is difficult to oxidize and that involved in the fluidity of lipoproteins. The antioxidant effect of polyphenolics is principally defined by the presence of orthodihydroxy substituents, which stabilize radicals and chelate. The antioxidant effect of phenolic acids and their esters depends on the number of hydroxyl group in the molecule. Argan oil, with comparison to olive oil, contains a higher quantity of ferulic acid (3470±13 versus 51±2 µg/kg of oil, respectively). This acid is more effective...
than ascorbic acid and other phenolic acid such as p-coumaric acid, since the electron donating methoxy group allows increased stabilization of the resulting aryloxyl radical through electron delocalization after hydrogen donation by the hydroxyl group. This showed that, the direct inhibition of trans-conjugated dienehydroperoxide isomer formation is related to the H-donating ability of the phenol. Argan oil, but not olive or sunflower oil, also contains another important phenolic acid: syringic acid (68±4µg/kg), this antioxidant compound protects against lipid peroxidation. B-carotene of argan oil may reduce cell damage, especially the damage to DNA molecules, thus playing the role in the repair of regeneration process of damaged liver cells. B-carotene of argan oil may scavenger free radicals generated by mercuric chloride and reduces the lipid peroxidation. The antioxidant mechanism of B-carotene has been suggested to be singlet oxygen quenching, free radical scavenging and chain breaking during lipid peroxidation.

Vitamin E, function as a trap for lipid peroxyl (LOO) and other radicals, effectively inhibiting the peroxidation of cellular membranes. Vitamin E prevents lipid peroxidation and maintains GSH and ascorbic acid levels in damaged tissue by inhibiting free radical formation. According to Roe and Sharma (2001), vitamin E showed protective effect against HgCl2 may be due to impaired absorption of mercury in the gastrointestinal tract. Ran et al (1996) postulated that, vitamin E has a protective effect against mercury toxicity. Vitamin E inhibits oxidative damage caused by mercury and cadmium intoxication. Saponin content of argan oil significantly inhibited peroxyl radical induced lipid peroxidation in rat kidney.

CONCLUSION

It may be concluded that combined treatment of argan oil has a protective and preventive effect on mercuric chloride induced oxidative stress. More-over, it protects from HgO2 induced renal dysfunction and executes its modulatory role in mercury induced free radical production.
