INTRODUCTION

Mercury is a well-known human and animal inducer of intensive kidney damage nephrotoxicant. Acute oral or parenteral exposure induces extensive kidney damage. Studies in vivo and in vitro have demonstrated that mercury induced lipid peroxidation, suggesting the involvement of oxidative stress in its cytotoxicity. Lund et al., (1993) reported that mercury enhances renal mitochondrial hydrogen peroxide formation in vivo and in vitro. However, causative correlation between mercury induced lipid peroxidation and cellular toxicity remains controversial. Some authors reported that lipid peroxidation plays a critical role in cell injury induced by mercury (Lund et al., 1993) in renal cells, whereas other investigators showed that lipid peroxidation is not directly responsible for mercury induced cell injury in hepatocytes and renal cells. It is important to develop an effective drug for mercury to prevent the mercury induced cellular damages. Historically, plants have been used as folk medicine against various type of disease.

Previous studies have been showed that the herbal origin antioxidants can reduce the oxidative stress induced by mercuric chloride. Therefore, treatments with antioxidant and radical scavengers such as vitamin E, vitamin C and herbal antioxidants were found to decrease the oxidative stress induced mercuric chloride. Ajuga iva (L.) Schreiber (Lamiaceae), locally known as “chendgoura”, in Algeria is used in phytomedicine around the world for a variety of diseases. Ajuga iva possesses hypoglycaemic, vasorelaxant and hypolipidemic effects, which have been experimentally demonstrated. Chemical studies on Ajuga iva aqueous extract have revealed the presence of severa flavonoids, tannins, terpenes and steroids. Since flavonoids have been reported to present antioxidant and hypcholesterolemic activity, it may be suggested that the antioxidant activity of Ajuga iva might be related to these compounds. Indeed, it is well established that flavonoids act as free radical scavenger that prevents lipid peroxidation and tannins and triterpenes have antioxidant effects.

The purpose of this study was to evaluate the protective role of aqueous extract of Ajuga iva on mercury chloride induced oxidative and renal stress in rats.

MATERIALS AND METHODS

All chemicals used in this work were purchased from sigma chemical company. Laboratory animals, Albino Wistar female rats, were brought from the Algiers Pasteur institute at the age of 4 weeks, with an average live weight of 200g. They were located in a room with an ambient temperature of 21±1°C and up to 12h of light daily. The rats were divided into four experimental groups; each consists of eight rats. The first group was served as the control. The second group was given Aqueous extract of Ajuga iva at a dose of 200 ml/kg body weight, while the third group (HgCl₂) was intraperitoneally given mercuric chloride at a dose of 1 mg/kg body weight. Finally, the fourth group was given combined treatment with aqueous extract of Ajuga iva and mercuric chloride. The treatment of all groups was lasted for 10 days. Twenty four hour after the last administration the blood was collected by retro- orbital sinus punction from each anesthetized rats. After centrifugation at 3000 rpm for 10min, the serum was separated immediately and stored at –20°C until
determination of: urea, creatinine and uric acid. Subsequently, rats were decapitated and kidneys were removed.

**Plant material and preparation of the Aqueous extract of Ajuga iva**

*Ajuga iva* (L.) Schreiber (Lamiaceae) plant was collected in north algeria (colo). The whole plant was washed well with water, dried at room temperature in the dark and then ground in an electric grinder to obtain a coarse powder. Then 50 g of the plant powder was suspended in 500 mL distilled water and heated under reflux for 30 min. The decoction obtained was centrifuged, filtered, frozen at -20°C and then lyophilised. The yield of the dry product was about 25% w/w, which was stored at -20°C until used.

**Tissue preparation**

About 500mg of kidney was homogenized in 4ml of buffer solution of phosphate buffered saline (w/v: 500mg tissue with 4ml PBS, PH 7.4) homogenates were centrifuged at 10,000g for 15min at 4°C. And the resultant supernatant was used for determination of: reduced glutathione (GSH), Thiobarbituric acid- reactive substance (TBARS) level, and glutathione peroxidase (GSH-PX) and glutathione –S-transferase (GST) activities.

**Determination of Biochemical parameters**

Serum urea, creatinine and uric acid were determined using automate analyses.

**Determination of lipid peroxidation (LPO)**

Lipid peroxidation level in the liver was measured by the method of Buege and Aust (1978)\(^\text{19}\), 125µl of supernatant were homogenized by sonication with 50 µl of PBS, 125 µl of 20% TCA + BHT 1% (TCA-BHT) in order to precipitate proteins, and centrifuged (1000xg, 10min, 4°c), afterwards, 200µl of supernatant were mixed with 40µl of HCl (0,6M) and 160µl of TBA dissolved in tris (120 mM), and then the mixture was heated at 80°C for 10min, the absorbance of the resultant supernatant was obtained at 530nm. The amount of TBARS was calculated using a molar extinction coefficient of 1.56x10^5 M/Cm.

**Determination of reduced glutathione (GSH)**

GSH content in liver was measured spectrophotometrically by using Ellman’s reagent (DTNB) as a colouring reagent, following the method described by Weckbekerectory (1988)\(^\text{20}\).

**Determination of glutathione-S-transferase (GST) (EC2.5.1.18)**

The cytosolic glutathione-S-transferase activity was determined spectrophotometrically at 37°C by method of Habig et al (1974)\(^\text{21}\). The reaction mixture (1ml) contained 0.334ml of 100mM phosphate buffer (PH 6.5), 0.033ml of 30mM CDNB and 0.33ml of reduced Glutathione. After pre-incubating the reaction mixture for 2min the reaction was started by adding 0.01ml of diluted cytosol and the absorbance was followed for 3min at 340 nm. The specific activity of GST is expressed as ìmole of GSH-CDNB conjugate formed/ min /mg protein using extinction coefficient of 9.6 Mm\(^{-1}\) cm\(^{-1}\).

**Determination of GSH-Px (E.C.1.11.1.9)**

Glutathione peroxidase (EC 1.11.1.9) activity was modified from the method of Flohe and Gunzler (1984)\(^\text{22}\). for the enzyme reaction, 0.2ml of the supernatant was placed into a tube and mixed with 0.4ml GSH (reduced glutathione, sigma product, analytical grade), and the mixture was put into an ice bath for 30min. then the mixture was centrifuged for 10min at 3000rpm, 0.48ml of the supernatant was placed into a cuvette, and 2.2ml of 0.32M Na\(_2\)HPO\(_4\) and 0.32ml of 1m mol/l 5,5’-dithio-bis(2-nitrobenzoic acid)(DTNB, sigma) were added for color development. The absorbance at wavelength 412nm was measured with a UV spectrophotometer after 5min. The enzyme activity was calculated as a decrease in GSH within the reaction time as compared to that in the non-enzyme reaction.

**Protein quantification**

Protein was measured by the method of Bradford (1976)\(^\text{23}\) using bovine serum albumin as the standard.

**Statistical analysis**

The data were subjected to student t test for comparison between groups. The values are expressed as mean ± SEM. Significance level was set at P<0.05, P<0.01, P<0.001.

**RESULTS**

**Effects of treatments on body, absolute and relative kidney weights**

Table 1 shows the effect of mercuric chloride, Aqueous extract of *Ajuga iva* and combined treatment with *Ajuga iva* and mercuric chloride. The marked decreased body weight of rats was observed in mercuric chloride treated rats and *Ajuga iva* + mercuric chloride group, but the result was not significant as compared to control. Along *Ajuga iva* showed increased body weight but result was not significant. The kidneys of rats treated with mercuric chloride were enlarged. Mercuric chloride treated rats showed a highly significant increased kidney weight and relative kidney weight (P<0.001) as compared to control. Combined treatment with *Ajuga iva* showed significant increased relative kidney weight, while alone *Ajuga iva* treatment had showed no significant effect.

**Effects of treatment on serum biochemical parameters**

A highly significant (P≤0.001) elevation in serum urea, creatinine and uric acid levels was observed in mercuric chloride intoxicated rats. Only *Ajuga iva* treatment did not show any significant alteration. However, the combined treatment of *Ajuga iva* with mercuric chloride show a highly significant decline in serum urea, creatinine
and uric acid levels was noticed respect to controls (table 2).

**Effects of treatments on renal oxidative stress parameters**

Mercuric chloride exposure a significant depletion in reduced glutathione level, GSH-Px and GST activities. And a highly significant increase in kidney lipid peroxidation level in mercury intoxicated rats was noticed. *Ajuga iva* alone treatment did not show any significant decline. In combined treatment of mercuric chloride with *Ajuga iva*, a highly significant increase in reduced glutathione level, GSH-Px and GST activities. And a significant depletion in lipid peroxidation level was recorded with respect to the control (Fig.1 and 2).

**Figure 1:** Reduced glutathione (nmol/ mg protein) and TBARS (nmol MDA/mg protein) levels in kidney of control and rats treated with Al, mercuric chloride, and combined treatment of mercuric chloride with Al after 10 days of treatment. Values are given as mean ± SEM for group of 6 animals each significant difference: * compared to controls (*P≤0.05; **P≤0.01; ***P≤0.001).

**Figure 2:** Enzyme activities of GPx (µmol GSH/ mg protein) and GST (nmol/min/mg protein) in kidney of control and rats treated with Al, mercuric chloride, and combined treatment of mercuric chloride with Al after 10 days of treatment. Values are given as mean ± SEM for group of 6 animals each significant difference: * compared to controls (*P≤0.05; **P≤0.01; ***P≤0.001).

**Figure 3:** T.S. of kidney of male rat treated with mercuric chloride (Hg) alone, and in combination with Al. (A) control (H&E100X): showing well develop glomerulus (1), with normal tubular cells; (B) Al alone treatment (H&E 100X): showing normal glomerulus (1), and normal tubular cells; (C) mercury treatment (H&E100X): showing degeneration of tubular cells (1), loss of nucleus (2), degeneration of glomerulus (3); (D) combined treatment of mercuric chloride with Al (H&E100X): showing normal glomerulus (1), normal tubular cells (2).

DISCUSSION

In the present study, oxidative stress induced by HgCl₂ was evidenced in kidney of rats by increase in lipid peroxidation level and the stimulation of GSH-Px, GST and catalase activities. Accordingly, oxidative stress induced by HgCl₂ has been previously reported. As consequence of lipid peroxidation biological membranes are affected causing cellular damage. In the present study, serum urea, creatinine, uric acid levels were significantly increased after 10 days mercuric chloride (1mg/kg), showing insufficiency of renal function. Studies in animals have established that tubular injury plays a central role in the reduction of glomerular filtration rate in acute tubular necrosis. Two major tubular abnormalities could be involved in the decrease in glomerular function in mercuric chloride treated rats: obstruction and backleak of glomerular filtrate. The alterations in glomerular function in mercuric chloride treated rats may also be secondary to ROS/reactive oxygen species), which induce mesangial cells contraction, altering the filtration surface area and modifying the ultrafiltration coefficient factors that decrease the glomerular filtration rate. The activity of GSH-Px and GST that can clear to protect the cells from being injured represents the competence of clearing free radicals from the organism. MDA content manifests the level of lipid peroxidation, and then indirectly represents the level of damage of the cell of renal mitochondria. Evaluating from GSH, MDA levels and GSH-Px, GST activities in kidney of rats, Hg alone significantly decreased GSH level, GSH-Px and GST activities and increased MDA content along with histological damage in kidney.

It was observed that Ajuga iva extract when given in combination with mercuric chloride significantly increases kidney GSH level, GSH-Px and GST activities as antioxidant potential and thereby declines the level of lipid peroxidation, which in turn reduces the urea, creatinine and uric acid in serum. In present investigation, the elevated level of GSH protects cellular proteins against oxidation through glutathione redox cycle and directly detoxifies reactive species. Glutathione, as both a carrier of mercury and an antioxidant, has specific roles in protecting the body from mercury toxicity. Glutathione, specifically bind with methylmercury, forms a complex that prevents mercury from binding to cellular proteins and causing damage to both enzymes and tissue. Glutathione-mercury complexes also reduce intracellular damage by preventing mercury from entering tissue and cells, and becoming an intracellular toxin. The elevated level of GSH-Px and GST by Ajuga iva as compared to the HgCl₂ may have facilitated the conjugation reaction of xenobiotics metabolism and may have increased the availability of non-critical nucleophile for inactivation of electrophiles and therefore might be playing a major role in metalloprotection. The Ajuga iva is a traditional herbal medicine used widely as antibacterial, antimalarial, sedative, antispasmodic, anti-inflammatory and relieve diarrhoea. Previous studies have been showed that Ajuga iva and its ingredient compounds inhibit the free radical generation and act as antioxidant and free radical scavengers and its has also been demonstrated that treatment with Ajuga iva inhibits the generation of superoxide radicals and recent evidence suggested that GSH-Px and GST play a significant role in the elimination of H₂O₂ and lipid peroxidative stress in rats. Thus, inhibition this enzymes may results in the accumulation of the H₂O₂ with subsequent oxidation of lipids. The present study has showed that MDA levels were significantly increased and the GSH-Px, GST activities were decreased with treated both dose of Ajuga iva in mercuric chloride.
groups when compared with control groups which confirmed with the histopathological evaluation of liver tissue. Flavonoids are the major component of *Ajuga iva* which are able to inhibit the oxidants and to protect the cell membrane. This study assesses the effects of oxygen free radical scavengers, both mercuric chloride injury and increase of TBA-reactive substance were inhibited by the treatment of free radical scavengers. *Ajuga iva* extract is an effective free radical scavenger showing antioxidant activity against reactive oxygen production and protecting the damage caused by free radicals. This result is supported with biochemical and histopathological findings which the effect of *Ajuga iva* on mercuric chloride induced oxidative stress in rats. The protective effect of *Ajuga iva* could be attributed to the improvement of antioxidant status of the animals of the presence of free radical scavenging substances such as flavonoid.

In conclusion, our study indicate that *Ajuga iva* extract have a protective effect against mercuric chloride induced oxidative stress in rats which may be related to its antioxidant effect.
