ABSTRACT

Periodontitis, or gum disease, affects millions of people each year. Periodontitis is a serious gum infection that damages periodontium (the soft tissues and bones present around tooth for support). The disease mainly occurs when bacteria in dental plaque infect the gums and bones that anchor the teeth. Periodontal diseases, if left unchecked, can lead to major health problems. Over the last decade, herbal and Ayurvedic drugs has become a subject of world importance, with both medicinal and economical implications. Herbal excipients are non-toxic and compatible they have a major role to play in pharmaceutical formulation. Herbal medicines have been widely used all over the world since ancient times and have been recognized by physicians and patients for their better therapeutic value as they have few adverse effects as compared to modern medicines. The aim of the present article is to present overall view of the current strategies adopted for the formulation and application of traditional herbal remedies. This review article summarizes the current data on the effect of natural products like Ocaciacatechu, Aloe vera, Azadirachata indica, Ocimum sanctum, Punica granatum & other important herbs on management of various periodontal diseases together with their biological activities.

Keywords: Herbal drugs, periodontitis, gingivitis, dental plaque

INTRODUCTION

Periodontal disease is one of the most important concerns for dentists and patients. It is recognized as a major public health problem throughout the world and is the most common cause of tooth loss in adults.2 The word “periodontitis” comes from perio (“around”), odont (“tooth”) and -itis (“redness”). Periodontitis is a set of diseases which usually attacks the periodontium. The periodontium is the specialized tissues that both surround and support the teeth, maintaining them in the maxillary and mandibular bones. Periodontitis in comparison with gingivitis is a more severe inflammation, because not only it affects the tissues, but also, it affects the bottom of the teeth. If it is not treated at all, it may lead to a loss of teeth.3,4

A variety of triggering factors like bacterial causes, dyscrasias, avitaminosis etc cause inflamed gums leading to gingivitis. Salivary tartar has an additive effect to these causative factors in causing gingivitis. Aggressive periodontitis, chronic periodontitis and those resulting from conditions like HIV, diabetes, malnutrition and immunosuppression are the other types of periodontitis.5 Researchers found that Actinobacillus actinomyctecomitans and Porphrymonas gingivalis these two bacteria appear to be likely to cause aggressive periodontal disease. Both P. gingivalis and A. actinomyctecomitans, along with multiple deep pockets in the gum, are associated with resistance to standard treatments for gum disease. Other bacteria associated with periodontal disease are Treponema denticola, T.socranskii, and P. intermedia. These bacteria, together with P. gingivalis, are frequently present at the same sites, and are associated with deep periodontal pockets.7

Morris reported that in the United Kingdom 40-45% of adults have moderate destructive periodontal disease and 5-10% has a severe form of the disease. They also reported that 72% of adults have visible plaque; which is the main causative factor of periodontal disease. In the United States 50% of adults have gingivitis affecting at least 3-4 teeth; two-thirds of the population has sub gingival calculus, and about a one-third have periodontitis.1,8

Pain, discomfort and cosmetic considerations are some of the factors that demonstrate severity of the problems associated with dental diseases and hence, it is of utmost importance to minimize and control dental diseases.9 Periodontal treatment aims to cure inflamed tissue, reduce the number of pathogenic bacteria and eliminate the diseased pockets. Mechanical therapy, chemotherapy and systemic administration of antibiotics are some of the clinical methods being utilized currently. Conventional therapy includes scaling - removal of the calculus and the plaque, curettage clearing the inflamed soft tissue, and root planning - removal of necrotic tissues on the root surface. Periodontal diseases are associated with bacterial infections; therefore antibacterial treatment seems to be an appropriate method of improving the condition of the inflamed tissues. One of the major problems associated with conventional treatment of
systemic administration of antibiotics is the distribution of drug throughout the body, which is not required and it can also give rise to toxicity problems.\textsuperscript{10}

One method of minimizing the distribution of therapeutic agents in the body is through the use of local drug delivery system.

Many antibacterial are applied directly to the mouth for the treatment of periodontal diseases. Mouth rinses, irrigating solutions and sustained release devices are some of the local delivery systems.

Periodontal local delivery devices that have been used for the targeted delivery of antimicrobial agents include: fibers (hollow and monolithic), strips and compacts, films, microparticles, gels and nanoparticles.\textsuperscript{11}

Despite several chemical agents being commercially available, these can alter oral microbiota and have undesirable side-effects such as vomiting, diarrhoea and tooth staining.\textsuperscript{12,13}

Hence, the search for alternative products continues and natural phytochemicals isolated from plants used in traditional medicine are considered as good alternatives to synthetic chemicals.\textsuperscript{14}

Herbal and natural products of folk medicine have been used for centuries in every culture throughout the world. “Let food be your medicine and let medicine be your food” was advised by Hippocrates, over two millennia ago. It’s still true today that “you are what you eat.”\textsuperscript{15}

The practice of medicine has evolved over many centuries to reach its current state.

A recent survey conducted by the World Health Organization estimated that almost 70–80% of the population in the developing world has resorted to traditional practices for treatment of a variety of ailments.\textsuperscript{16}

The populations of the two most populous countries in the world, China and India, have practised traditional medicine for the management of oral diseases, including periodontal disease, for well over 2000 years.\textsuperscript{17}

With respect to diseases caused by microorganisms, the increasing resistance in many common pathogens to currently used therapeutic agents, such as antibiotics and antiviral agents, has led to renewed interest in the discovery of novel anti-infective compounds.

As there are approximately 5,00,000 plant species occurring worldwide, of which only 1% has been phytochemically investigated, there is great potential for discovering novel bioactive compounds from these sources.\textsuperscript{18}

Plants and natural products from time immemorial used for their pharmacological applications viz., antiulcerogenic, wound healing, anti-inflammatory, antimicrobial, antioxidant properties etc. Here is a list of few of these in Table 1.

The purpose of this review is to present some recent examples of traditional medicinal plant extracts or phytochemicals that have been shown to inhibit the growth of oral pathogens, reduce the development of dental plaque and reduce the symptoms of oral diseases.

Various plants and their immense potential in management of dental health :

1. \textit{Acacia catechu Wild}

\textit{Acacia catechu} Wild. (AC)(Family: Fabaceae and subfamily: Mimosoideae) known as Black Khair. AC is commercially used to obtain Katha (a concentrated filtered extract) in North India.

AC is used as mouthwash for mouth, gum and throat diseases like gingivitis, stomatitis. Cutch and katha is cooling, digestive and a very valuable astringent, especially in chronic diarrhoea and dysentery, bleeding piles, uterine haemorrhages, leucorrhoea, gleet, atonic dyspepsia, chronic bronchitis, etc.

The decoction of bark mixed with milk is taken to cure cold and cough.\textsuperscript{23-27}

\textbf{Figure 1: Acacia catechu}

The extracts of AC have been reported to have various pharmacological effects like antipyretic, anti-inflammatory, anti diarrhoeal, hypoglycaemic, hepatoprotective, antioxidant and antimicrobial activities.\textsuperscript{23,25-29}

The important chemical constituents reported in the heartwood are catechin, catechutannic acid, epicatechin, catechin tetramer, dicatechin, gallocatechin, kaempferol, taxifolin, isorhamnetin, (+)Azelechin, L-arabinose, D-galactose, D-rhamnose and aldobiuronic acid. Catechinis highly active. It is used as a haemostatic.\textsuperscript{30}
Role of *Acacia catechu* on Management of Periodontal disease

A herbal tooth powder which removed plaque, stain or patches and cleaned and polished tooth surfaces without any abrasive action, comprised the powder of *Acacia catechu*, Menthol and camphor in the proportion about 15 days of treatment.

Aloe vera is found to possess good wound healing activity.40 Aloe Vera contains 6 antiseptic agents: Lupeol, salicylic acid, urea, nitrogen, cinnamonic acid, phenols and sulfur. They all have inhibitory action on fungi, bacteria and viruses. Aloevera has been found to be useful in cancer prevention, aphthous stomatitis, mucositis, and radiation dermatitis.41-44

Aloe vera is a potent anti inflammatory agent it inhibits the cycloxygenase pathway and reduces prostaglandin E2 production from arachidonic acid.45 Aloe vera is a potent laxative,46 it exhibits potent anti viral and anti tumoricactivity.47 AloeVera possess good anti bacterial and anti fungal activity, Streptococcus pyogenes and Streptococcus faecalis are two microorganisms that have been inhibited by aloe veragel.48,49 Using a rat model, in a study it was suggested that the antibacterial effect of the
It was proposed that a glycoprotein, aloctin A, which was isolated from Aloe arborescens, markedly inhibits arthritis in rats and carrageenan-induced edema in rats. It later identified an anti-inflammatory agent as C-glucosyl chromone from Aloe barbadensis. It is recently reported that aloe vera leaf pulp extract was effective in reducing blood sugar, suggesting that it might be useful in the scavenging of free radicals. It was reported that treatment with aloe vera increased antioxidant enzymes and significantly reduced lipid peroxidation products in streptozotocin induced diabetic rats, showing the relationship between antioxidant activity and the onset of diabetes.

Role of Aloe Vera in Management of periodontal disease

Figure 2: Aloe vera

The aloe vera plant contains anthraquinone glycosides (especially in the latex form, which is different from the gel), polysaccharides, aloesins, glucomannans, and βsitosterol. Antioxidative phenolic compounds were recently isolated from Aloe barbadensis and identified as aloesin derivatives. These properties, along with the ease of availability, no known adverse effects, and cost effectiveness, make aloe vera an ideal candidate for plaque control, thereby reducing gingivitis and most likely eventual periodontitis. Treatment of inflammation is still the key effect for most types of healing, and immunomodulatory properties of the gel polysaccharides, especially the Acetylated mannans from aloe vera, seem to play a key role.

Antidiabetic, anticancer, and antibiotic activities of aloe vera have also been reported, indicating wider use of this gel. Studies observed a significant reduction in plaque and gingivitis after a 30-day use of mouth rinse containing aloe vera with toothbrushing. It was found out that both dentifrice containing aloe vera and fluoride resulted in significant reduction of plaque and gingivitis, but no statistical significant difference was observed between them that inactivates bradykinin in vitro, salicylates, and a substance that inhibits thromboxane formation.

Compositions that were safe and effective for preventing and treating oral disease and for maintaining good oral health for both humans as well as animals has been described. The composition contains a herbal ingredient such as olive leaf extract, black walnut green hulls, clove leaf, thyme herb, grapefruit seed extract, Aloe vera, Calendula flower. Echinacea purpurea, gota kola extract, chamomile flower, green tea leaf, oregano leaf, peppermint oil, cinnamon bark, eucalyptus leaf, lavender oil etc.

The aloe vera extract treatment has also resulted in a significant increase in reduced glutathione, superoxide dismutase, catalase, glutathione peroxidase, and glutathione S transferase in the liver and kidney of diabetic rats, showing the antioxidant property of aloe vera gel extract. Thus, it can be hypothesized that aloe vera extracts can be useful in the control and treatment of periodontal diseases by virtue of their antioxidant properties as well.

3. Neem (Azadirachta indica)

Azadirachta indica (syn. Melia azadirachta) is well known in India and its neighboring countries for more than 2000 years as one of the most versatile medicinal plants having a wide spectrum of biological activity. Every part of the tree has been used as traditional medicine for household remedy against various human ailments, from antiquity.

More than 135 compounds have been isolated from neem. The main active ingredients are named nimbin, nimbinin, and nimbidin. All parts of the plant yield 6-sitosterol. The nee leaves contain 6-desacetylnimbine, nimbadiol, nimboline and quercetin, n-hexacosanol and nonacosane. The diterpenoids margolone, nimbogone, nimbonolone and nimbolinin have also been isolated from the plant. Various parts of the neem tree have been used as traditional Ayurvedic medicine in India from time immemorial.

Neem oil, bark and leaf extract have been therapeutically used as folk medicine to control leprosy, intestinal helminthiasis, respiratory disorders, constipation and as health promoter. Studies indicate that neem leaf extract possess antiarrhythmic, antiarthritis, antiviral, antioxidant, hepatoprotective and antidiabetic activity.

Role of Neem in management of periodontal disease

The ancient Ayurvedic practise of using Neem to heal and rejuvenate gum tissue and to prevent cavities and gum disease is verified in modern clinical studies.

Some of the observed anti-plaque activity of neem chewing sticks is attributed to the fibrous nature of these sticks resulting in mechanical plaque removal; however, neem plant also contain chemotherapeutic antiplaque
agents. The presence of gallotannins during the early stages of plaque formation could effectively reduce the number of bacteria available for binding to the tooth surface by increasing their physical removal from the oral cavity through aggregate formation. Additionally, the effective inhibition of glucosyl transferase activity and the reduced bacterial adhesion to SHA, as seen with the presence of gallotannin extracts, suggest some potential anti-plaque activity. The microorganisms found in inflamed gums are resistant to penicillin and tetracycline but are not resistant to antibacterial plant extracts like neem. Unlike antibiotics, antibacterial plant extracts produced no allergy in the gingiva that could inhibit their effectiveness.

In a clinical study, 50 patients with confirmed gingivitis were selected, 40 showed severe bleeding and puscular discharges from the gums. After just three weeks of brushing twice a day with paste including neem leaf extracts, eight out of ten patients showed significant improvement. The patients also showed a reduction in bacterial populations and elimination of halitosis (bad breath) with no side effects.

A synergistic herbal formulation comprising of active fractions from Azadirachta indica, Citrullus colocynthis and Cucumis sativus extract and a carrier or additive was developed. The composition was found to be useful for teeth and gums as mouthwash or mouth rinse. This herbal formulation was described to be useful for preventing dental plaque and gingivitis in humans and also as an antimicrobial agent for preventing periodontal diseases.

A clinical study conducted on 60 volunteer subjects to evaluate the efficacy of fraction from neem, fraction from Citrullus colocynthis and a mixture of them on the reduction of dental plaque led to significant reductions of dental plaque.

4. Tulsi (Ocimum sanctum)

Botanical name is Ocimum sanctum, Tulsi was recognized thousands of years ago as one of the India’s greatest healing herb. It is an erect soft, hairy aromatic herb or undershrub found throughout India. Several medicinal properties have been attributed to Ocimum sanctum. Different parts of Tulsi plant e.g. leaves, flowers, stem, root, seeds etc. are known to possess therapeutic potentials and have been used by traditional medical practitioners as expectorant, analgesic, anticancer, antiasthmatic, antiinflammatory, diaphoretic, anti-diabetic, antifertility, hepatoprotective, hypotensive, hypolipidimic and antistress agents. Tulsi has also been used in treatment of fever, bronchitis, arthritis, convulsions etc.

In an in-vitro study the various concentrations of the Tulsi extracts have been assessed against streptococcus mutans and concluded that the Tulsi extract 4% has a maximum antimicrobial potential.

Tulsi can act as COX-2 inhibitor, like modern analgesics due to its significant amount of Eugenol (1-hydroxyl-2methoxy-4 allyl benzene). Ocimum sanctum leaves contain 0.7% volatile oil comprising about 71% eugenol and 20% methyl eugenol.

Ocimum sanctum at a dose of 100 mg/kg was found to be effective antiulcer agent in a study. Anti-ulcer effect of Ocimum sanctum may be due to its cytoprotective effect rather than antisecretory effect. Due to its immunomodulating property Ocimum sanctum may find its potential use in treating immunologically mediated mucosal condition like pemphigus.

Role in the management of periodontal disease

Tulsi leaves are quite effective in treating common oral infections. Also few leaves chewed help in maintaining oral hygiene. Carracrol and Tetpene are the antibacterial agents present in this plant. Sesquiterpene bcaryophyllene also severs the same purpose. This
constituent is FDA approved food additive which is naturally present in Tulsi.\textsuperscript{83}

Tulsi leaves dried in sun and powdered can be used for brushing teeth.\textsuperscript{89} It can also be mixed with mustard oil to make a paste and used as toothpaste. Tulsi has also proven to be very effective in counteracting halitosis. Its anti-inflammatory property makes it a suitable remedy for gingivitis and periodontitis, and it can be used for massaging the gingiva in these conditions.\textsuperscript{88}

Tulsi contains Vitamin A and C, calcium, zinc and iron. It also has chlorophyll and many other phytonutrients. Deficiency of these nutrient has been associated with variety of oral diseases.\textsuperscript{89}

5. Turmeric (Curcuma Longa)

![Figure 5: Turmeric](image)

It is a rhizomatous herbaceous perennial plant of family Zingiberaceae. It is native to tropical South Asia and needs temperatures between 20 °C and 30 °C. It is a perennial plant with orange, oblong tubers 2 or 3 inches in length and one inch in diameter, pointed or tapering at one end. When dried, it is made into a yellow powder with a bitter, slightly acrid, yet sweet taste. Ancient Indian medicine has touted turmeric as an herb with the ability to provide glowl and luster to the skin as well as vigor and vitality to the entire body. Since turmeric has antimicrobial, antioxidant, astringent, and other useful properties, it is quite useful in dentistry also.\textsuperscript{91,92}

The active constituents of turmeric are the lavonoid curcumin (diferuloylmethane) and various volatile oils including tumerone, atlantone, and zingiberone. Other constituents include sugars, proteins, and resins. The best-researched active constituent is curcumin, which comprises 0.3-5.4% of raw turmeric. Curcumin has been used extensively in ayurvedic medicine for centuries, as it is nontoxic and has a variety of therapeutic properties including antioxidant, analgesic, anti-inflammatory, antiseptic activity, and anticarcinogenic activity.\textsuperscript{93} Its role in the treatment of various precancerous conditions like oral submucous fibrosis, leukoplakia, and lichen planus has also been studied. Turmeric extract and turmeric oil have demonstrated oncopreventive activity in in vitro and in vivo animal experiments.\textsuperscript{94}

Role in the management of periodontal disease

Massaging the aching teeth with roasted, ground turmeric eliminates pain and swelling.\textsuperscript{93} A study concluded that chlorhexidine gluconate as well as turmeric mouthwash can be effectively used as an adjunct to mechanical plaque control methods in prevention of plaque and gingivitis. The effect of turmeric observed may be because of its anti-inflammatory action. Reduction in total microbial count was observed in both the groups. It is reported that the local drug delivery system containing 2% whole turmeric gel can be used as an adjunct to scaling and root planing. There was a significant reduction in the trypsin-like enzyme activity of “red complex” microorganisms.\textsuperscript{96}

Another study it was seen that, 1% curcin solution can cause better resolution of inflammatory signs than chlorhexidine and saline irrigation as a subgingival irrigant. Mean PPD reduction was significantly greater for the curcumin group than all other groups on all post-treatment days.\textsuperscript{97}

6. Pomegranate (Punica granatum)

Punica granatum (family Punicaceae), generally known as “pomegranate,” is a shrub or small tree native to Asia where several of its parts have been used as astringent, and for hemostatic as well as diabetic control.

The fruit of this tree is used for the treatment of throat infections, coughs, and fever due to its anti-inflammatory properties.\textsuperscript{99}

The constituents of pomegranate have been thoroughly investigated, however, clinical trials are in progress to explore the therapeutic potential of pomegranate products, particularly determining preventive efficacy of pomegranate extracts in cancer, cardiovascular diseases, inflammation diabetes and ultraviolet radiation-induced skin damage.

The most therapeutically beneficial pomegranate constituents are ellagic acid, ellagitannins (including punicalagins), punicic acid, flavonoids, anthocyanidins, anthocyanins, and estrogenic flavonols and flavones.\textsuperscript{100}

Pomegranate extracts have been shown to scavenge free radicals and decrease macrophage Oxidative stress and lipid peroxidation in animals and increase plasma antioxidant capacity in elderly humans. Also pomegranate extracts (juice, seed oil, peel) potently inhibit prostate cancer cell invasiveness and proliferation, cause cell cycle disruption, induce apoptosis, and inhibit tumour growth.\textsuperscript{101}

Role in the management of periodontal disease

Research showed that pomegranate extract was more effective against the adherence of biofilm
microorganisms than a pharmaceutical antifungal, when three or four microorganisms were involved.102

Investigators noted that pomegranate’s active components, including polyphenolic flavonoids (e.g., punicalagins and ellagic acid), are believed to prevent gingivitis through a number of mechanisms including reduction of oxidative stress in the oral cavity,103–105 direct antioxidant activity; anti-inflammatory effects;106,107 antibacterial activity;108 and direct removal of plaque from the teeth.109

Pomegranate rinsing also lowered saliva activities of alpha-glucosidase, an enzyme that breaks down sucrose (sugar),111 while it increased activities of ceruloplasmin, an antioxidant enzyme.112 “The pomegranate extract-induced increase in ceruloplasmin activity can be expected to strengthen antioxidant defences,” noted investigators. Subjects who rinsed with placebo solution did not experience any of these changes.113 Taken together, researchers concluded that these changes in saliva content indicated that routine rinsing with a pomegranate mouthwash, could promote oral health, including affecting processes related to gingivitis.113

Other Herbs

1. Drynaria

One of the traditional Korean medicine, Drynaria fortune (D. fortunei; Gol-Se-Bo in Korean and Gu-Sui-Bu in Chinese) is one of candidates known to be effective for the treatment of inflammation, hyperlipidemia, arteriosclerosis, rheumatism, and gynaecological diseases such as osteoporosis and bone resorption in oriental medicine.115–117 D. fortunei is also commonly used to manage disorders of orthopedics and has been claimed to have therapeutic effects on bone healing.115,116 Liu has shown that D.fortunei has an antioxidant effect on rat osteoblasts from hydrogen peroxide-induced death and may promote bone recovery under similar pathologic conditions.118 Liu reported that D. fortunei increases the attachment and growth of human gingival fibroblasts on in vitro.119 The water extract of D. fortunei has been reported to significantly protect against otoxicity caused by treptomycin, streptomycin and kanamycin in human and the progression of bone loss induced by ovariectomy in rats.120,121 Moreover, it was also shown that D. fortunei extracts are shown to be potent inhibitors of the degradation of denaturated collagen by cathepsin K and of bone resorption in an in vitro model.122

2. Garlic (Allium sativum)

Historically, garlic was used in China to lower blood pressure, in Egypt to increase physical strength, in Europe to prevent the plague and in India as a home remedy for various minor ailments like flu and cough. Garlic has been used not only to flavour food but also because it contains a sulfur-rich derivative of cysteine felt to have medicinal benefits. Its anticarcinogenic actions may be explained by particular organo-sulfur compounds. Diallyl sulfide, for example, which is responsible in part for its strong taste and odor, has been shown to selectively inhibit as well as induce certain P-450 enzymes.123

As S.mutans is one of the primary etiological organisms in dental caries development, and in this study garlic extract has been shown to be effective against S.mutans, garlic extract mouth rinse might be used as an effective remedy in the prevention of dental caries.124

In a study it was found that the garlic has antimicrobial properties in vitro against streptococci and anticariogenic properties against oral microorganism.125

Allicin is considered the most therapeutic constituent of garlic. Research performed using broth dilution method revealed that planktonic growth of the cariogenic, gram-positive species S.mutans, S.sobrinus, and Actinomyces oris was inhibited by various allicin concentrations. Planktonic growth of the tested gram-negative periodontic species A. and Fusobacterium nucleatum was also inhibited by allicin.126

3. Onion (Allium cepa)

Onion has the distinction of being the king of vegetables. Its extensive use in various forms due to the antibacterial and antifungal properties is well documented. It promotes good heart health because it facilitates the thinning of the blood which helps to prevent clot formation. Onion extracts possess an effect on all test bacterial strains (S.mutans JC-2, S.sobrinus OMZ176, P.gingivalis ATCC 33277 and P.intermedia ATCC 25611), and the effects were bactericidal against cultured and resting bacterial cells.127
Studies of experimental carcinogenesis in animal models and in cell culture systems indicate that several allium-derived compounds exhibit inhibitory effects and that the underlying mechanisms may involve both the initiation and the promotion phases of carcinogenesis. The potential anticarcinogenic action of onions may also be related to their high content of organosulfur compounds or to their high antioxidant activity, which is principally due to their wide content of flavonoids.

Allium cepa juice (0.4g/100g b.w. for 4 weeks) exhibited anti-hyperglycemic and antioxidant effect in alloxan induced diabetic rats, it also repaired hepatic and renal damage caused by alloxan.

4. Grape Seed Extract

Grape seed extract contains proanthocyanidins (PA) which are potent antioxidants and are known to possess anti-inflammatory, antibacterial and immune-stimulating effects. It has been reported to strengthen collagen based tissues by increasing collagen cross-links. In a study conducted to determine re-mineralizing effects of grape seed extract on artificial root caries, results showed that it is a promising natural agent for non-invasive root caries therapy.

5. Cloves (Syzygium aromaticum)

The dried flower buds of an East Indian evergreen tree, cloves are popularly used as a spice. They also yield a volatile oil used medicinally and in perfumes. Cloves have antiseptic, stimulant, and antiemetic (vomiting preventive) properties and are used to treat the mouth, stomach, intestines, circulation, and lungs.

Eugenol extracts from clove have often been used in dentistry in conjunction with root canal therapy, temporary fillings, and general gum pain, since eugenol and other components of clove (including beta-caryophyllene) combine to make clove a mild anaesthetic as well as an anti-bacterial agent.

Eugenol, the primary component of clove’s volatile oils, functions as an anti-inflammatory substance. Clove also contains a variety of flavonoids, including kaempferol and rhamnetin, which also contribute to clove’s anti-inflammatory (and antioxidant) properties.

6. Mango (Magnifera indica)

Mango leaf contains ascorbic and phenolic acids which are known to possess antibacterial properties. Studies have shown that mango leaves (magnifera indica) possess antibacterial properties against anaerobic dental microflora such as P. intermedia and P. gingivalis and can effectively be used as adjunct for maintenance of oral hygiene.

CONCLUSION

Pharmacologically active phytochemicals useful for the prevention, treatment and maintenance of periodontal diseases have been widely identified. They may be tannins, terpenoids, flavanoids, alkaloids etc. Antimicrobial activities of these have been found to be particularly useful for periodontal diseases. Clinical trials for assessment of safety and efficacy of these herbal remedies are in its infant stage. These herbal remedies are expected to be a widely used in future. The herbal remedies have an edge over conventional antibiotic treatment which suffer the limitation of low benefit to high risk as compared to herbal treatment which possess high benefit to low risk ratio.

As traditional plant preparations have significant historical background, it may be ethical to clinically evaluate these first and then collect modern toxicological data. Important classes of compounds essential for biologic activity must be delineated. All of this knowledge will be essential for proper standardization of a product. Therapeutic approaches with herbal medicine are often staggered due to lack of data on safety and efficacy and meticulous clinical trial evidence. It is recommended that more researches should be undertaken.

Standardization and quality assurance of these herbal remedies is also a key area to be focused in future and efforts have been initialized towards this target. There are much more opportunities for further research in the utility of herbal remedies for periodontal diseases. More organized and long-term research is to be carried out to support the use of established remedies. Development of novel drug delivery systems for these herbal ingredients is likely to be one of the thrust areas of research in future.

Research on colloidal drug delivery systems such as nanoparticles, nanoemulsion etc seems to be promising.
